

Lau Ching Kwok (Timothy)

Product Designer · Product Design for Complex Business Models & New Product Needs Discovery

nekoking2010@gmail.com | linkedin.com/in/timothyck | nekock.github.io/timothy-portfolio-v2

9 years of Product Design experience, specializing in complex product problems involving user needs, business goals, and technical constraints.

Strengths: identifying user friction, proposing solutions, assessing risks, and making high-impact product trade-offs under limited resources.

Experience: focused on improving core flows, redefining app usage value, and exploring new business models. Years of hands-on experience using market research, prototypes, and data-driven validation to guide product direction.

Industry experience across FinTech, AI, Cybersecurity, IoT, and Energy, with cross-market research in Taiwan, Japan, and Hong Kong and cross-border product collaboration.

CORE SKILLS

Flow optimization & success-rate improvement / New product value & needs discovery / Research, data & prototype validation / Business, UX, cross-functional & cross-market collaboration

Tools: Figma / Claude / Photoshop / Illustrator / AI-assisted Prototyping

4 Languages & Cross-Market Communication: Chinese / Japanese / English / Cantonese

Chinese: Native; primary working language / Japanese: JLPT N1; raised in Japan; independently conducts market research, user interviews, and cross-border collaboration

English: Business communication; able to participate in English meetings and write documentation / Cantonese: Native; Hong Kong market research and collaboration experience

EXPERIENCE

Freelance Product Designer | Taiwan

Jun 2026–Present

Supporting an online-course company with market strategy decisions and product design: clarifying market and potential-user needs, defining testable market strategies, and iteratively adjusting product direction.

- Value Spark urgently needed to build a market-validation workshop for a career-transition course from scratch within 2 months to decide whether to enter the Taiwan market. Through competitor analysis, potential-user journey mapping, and pain-point-focused course design, I designed 4 course workshops within 1 month.
- Designed course content for an unreleased “New Graduate Job Search” program that successfully attracted target customers, creating the first success case within 1 month.

AIFT, Taiwan | Product Designer / Product Planning

Aug 2022–May 2026

Responsible for B2B products from problem definition, data and needs analysis through delivery, collaborating with product, engineering, and sales to improve product experience and explore new product and business opportunities across AI, Cybersecurity, and FinTech products serving multiple Asian markets.

- The original cybersecurity-service website had an 85% bounce rate, only 5 seconds of average engagement, and approximately 5,000 potential enterprise customers leaving each month; through qualitative enterprise interviews and usability analysis, I restructured the information and experience, increasing page views by 200% and average engagement from 5 to 40 seconds after launch.
- For a traditional sales team, optimized and shortened the inbound customer-call service flow; after understanding requirements with sales and engineering, designed an AI customer-service solution. Estimated annual impact after automation: ~720 hours and NT\$1.5M in labor-cost savings.
- Starting from a highly customized service model limited to 1 project per month, restructured customer needs and delivery workflows; within 1 month, aligned cross-functional practices and extended the offering into 3 business models, increasing company capacity by 200% (1 → 3 projects/month).
- Converted a highly customized enterprise insurance product into a reusable SaaS delivery framework. Designed insurance sales-page templates and modularized delivery flows. Cut client requirement-confirmation time from 1 week to 2 days and shortened the product delivery cycle by 67% (3+ months → ~1 month).
- Created a shared design system for 2 large cybersecurity products, saving 50% in maintenance cost and MVP redesign/development time; doubled production efficiency (2 weeks → 1 week), accelerating new-product and market validation.

Contract Product Designer

Aug 2021–Aug 2022

Helped improve the existing experience of a FinTech app, using research, prototyping, and usability testing to identify friction in core flows.

- In the original P2P lending core flow, the borrowing success rate was only 24%; redesigned borrower and investor app flows and continuously validated through Prototype and usability testing, raising the borrowing success rate ~3.3× within 3 months (24% → 80%).

NextDrive, Taiwan | Product Designer

Oct 2020–Jul 2021

Responsible for market research on energy products in Taiwan and Japan. Researched users in both markets and conducted cross-market validation to help the company decide whether products should develop toward ToC or ToB; research covered smart meters and home/enterprise energy-management services.

- Before developing a Taiwan ToC smart-energy product, I was mainly responsible for evaluating market feasibility in Taiwan and Japan. Interviews with potential users and Prototype validation in both markets showed weaker-than-expected ToC demand; I recommended prioritizing ToB. Management adopted the recommendation, shifting the product direction from ToC to ToB and avoiding approximately NT\$10M of direct investment in a market with demand concentrated among a small audience, limited scale, and a low growth ceiling.

NLP, Taiwan | Founding Member / Product Designer / Product Planning

Nov 2019–Sep 2020

Responsible for product planning and business-model exploration for an AI Agent startup. Unlike typical platforms that infer needs from browsing history, the product let users create personal AI agents that remembered preferences and current needs and proactively searched for and filtered suitable products and services.

- The original AI Agent product was ToC-focused and lacked a ToB revenue model; I led the design of a new service that used existing user preferences and real-time needs to help ToB merchants find customers. I designed an end-to-end flow covering supplier matching → AI ad assets → storefront setup → ad placement, and repeatedly tested Prototypes with 10 merchants, confirming usage interest and MVP direction and successfully opening a ToB business model for the company.

FLH, Taiwan | Product Designer / Acting PM

Nov 2018–Nov 2019

Responsible for product positioning and user-experience design for smart-home and IoT products, co-designing product services with partners including KDDI in Japan.

- The original product only supported single-device control and required many steps, giving the app little obvious value over physical switches. User interviews showed that people actually wanted to switch an entire living context at once, so I repositioned the product from “device control” to a “scenario-based smart-home service” and simplified the core flow, doubling overall operating fluency and reducing time by about 50% (10s → 5s).

OEUF, Hong Kong / Japan | Co-founder

Mar 2017–Nov 2019

Responsible for Hong Kong/Japan elderly-care market research and early-stage service-model exploration.

- The company originally had only a broad elderly-care service concept. Through interviews with nearly 100 foreign care workers in Hong Kong and Japan, I found caregiving capability and professional credentials were the core trust issues, helping the company focus the product direction on caregiver training and professional certification, then continue engaging the market and validating the service direction through small-scale events and seminars.

EDUCATION

M.S. in Electronics Engineering | National Chiao Tung University | 2013–2015 · B.S. in Electronics Engineering | National Chiao Tung University | 2009–2013

INTERESTS

Methodology & Psychology Books / Innovation Workshops / Photography / Languages & Cross-cultural Exchange / Independent Travel & Urban Observation
